

Case Study 2 – Health and Safety Management System

New Level was commissioned by a global organisation to benchmark their existing Safety Manual as this was misinterpreted to be their definitive Health & Safety Management System.

Whilst the client perceived their operations to be predominantly low risk, the ownership, responsibilities and practices employed in relation to health and safety were not clearly defined and the hazard / risk management process was unsuitable to meet the client needs.

New Level reviewed the health and safety provisions and operational activities and identified the need for a comprehensive Health & Safety Management System that was suited for implementation across all our client's sites across Europe.

On behalf of our client, New Level developed a Management System in co-operation with senior and operational employees. This was bespoke to meet the needs of the client's business operations across their European portfolio and included generic health and safety processes to permit implementation with consideration of local and cultural requirements.

We provided extensive support and conducted risk assessments in relation to Fire Safety, Workplace Activities and Expectant Mothers.

The Health & Safety Management System is now fully operational across their entire portfolio and has proven to significantly reduce workplace accidents, incidents and near-misses due to integrated controls with the day to day business activities of our client.

New Level continue to provide support to measure continued compliance with the HSE-MS and maintain corporate communication and advisory support as a key member of their corporate health and safety management committee.
